June 6, 2018 - Coding Interview Meetup @ Warm Springs, Fremont California

I attended this meet-up of technical coders because as part of Springboard Data Science career track I'm emphasizing to build my coding skills for initial questions in any Data Science interview positions are mostly coding & decision makers. We were all coming with common interest to talk about latest coding problems given in any job interviews.

This was a mixed group of experienced Software developers and fresh college graduates who are either aspiring for promotions, career change or applying for new job. Everyone was contributor to the group enriching each with new set of coding problem. Since this was time bound session of two hours so organizer had laid out agenda of discussing any two coding problems of interest to the group. The problems discussed were lot of knowledge add to me since it talked about linked list and deducing maximum profit from stocks. Both the problem sets were tried by me in the past however I could discuss my code with the group and found ways to improve/ optimize the code from space & performance perspective too. This was really a worthwhile update and I could not have gathered it had it not been my joining this meetup. I exchanged contact information to the group and as well talked about their additional interests in professional & personal areas. I could instantly add five of new contacts in my linkedin network. This was another bonus of networking & meeting people.

 I truly cherish my first experience of coding meetup and will continue to schedule more and be consistent in it. This is a quick way to know new people, knowledge in refreshing way.
